FACILITY: EXECUTIVE, MEMORY MANAGEMENT DATA BASE

ABSTRACT: MDAT ALLOCATES AND INITIALIZES THE STORAGE FOR THE MEMORY MANAGEMENT DATA BASES. IT IS ASSEMBLED IN TWO FORMS ONE TO PRODUCE A SKELETON SPT AND THE OTHER TO PRODUCE THE SYSTEM MEMORY MANAGEMENT DATA STRUCTURES.

ENVIRONMENT:

.SBTTL HISTORY ; DETAILED

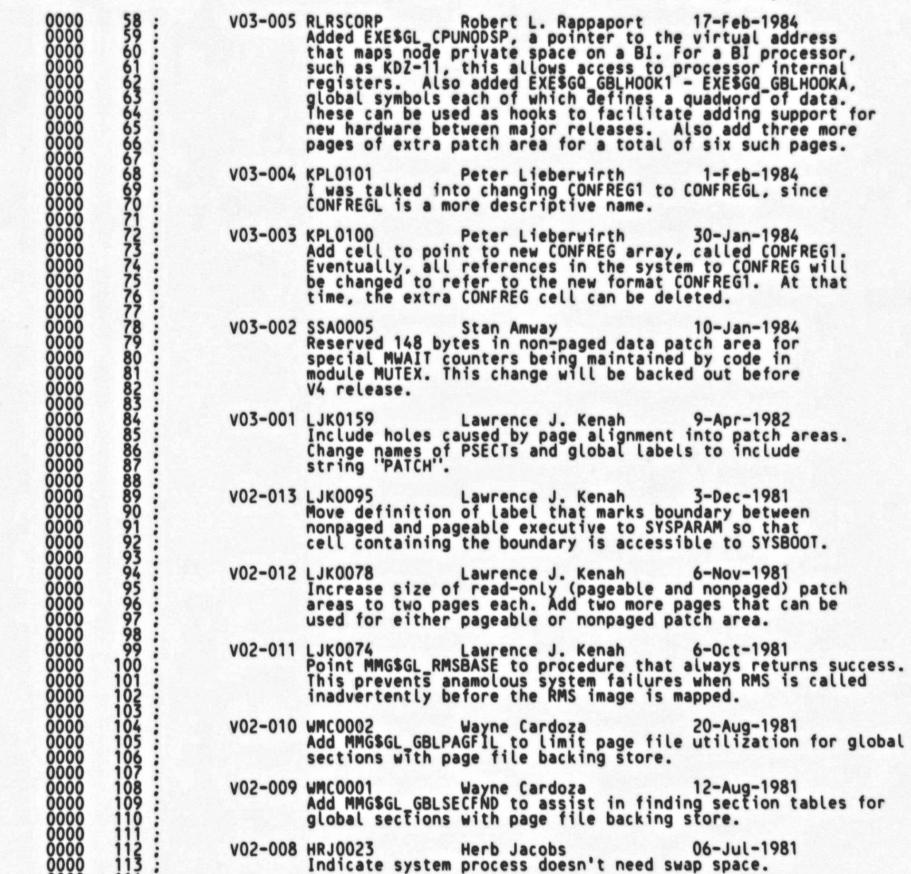

AUTHOR: RICHARD I. HUSTVEDT , CREATION DATE: 18-MAY-1978

MODIFIED BY:

V03-007 WHM0001 Bill Matthews 02-May-1984
Make PAT\$A_NONPGD_CODE_END global for use by \$Y\$BOOT to initial MMG\$GL_PGDCOD.

V03-006 LJK0273 Lawrence J. Kenah 10-Apr-1984
Only set a single page to UREW to hold file system statistics.
Add cells to hold base addresses of various loadable images.
Remove cells added for MWAIT measurements.

. SUBTITLE

READ-ONLY PATCH AREAS

There is a single page of read-only patch space located at the boundary between the nonpaged and pageable exec routines. This page is used for patches to the nonpaged routines in SYS.EXE. There are two pages located in the middle of the pageable exec routines that are used for a pageable patch area.

In addition, there are three more pages located at the boundary between the nonpaged and pageable exec routines. These pages are all initially pageable. If either read-only patch area needs room to expand, one of these pages can be used.

- o If a pageable page is required, it should be taken from the high address end (the third page). A patch descriptor must be added for each page in this area used for pageable patch
- o If more nonpaged patch space is needed, that can be obtained by extending the current nonpaged patch area. This expansion consists of two steps. The first longword in the patch descriptor (global label PAT\$A_NONPGD_CODE) must be increased by 512 to reflect the size increase in the patch area. The contents of the cell MMG\$GL_PGDCOD, the boundary between the nonpaged and pageable exec, must be increased by 512 to reflect the fact that the nonpaged exec has grown by a page. To simplify location of these two cells, they have additional labels that clearly relate them to expanding nonpaged read-only patch area. MMG\$GL_PGDCOD is now loaded from BOO\$GL_PGDCOD in SYSBOOT and therefore BOO\$GL_PGDCOD must be patched with the increased size. MMG\$GL_PGDCOD will get the increased size on reboot. MMG\$GL_PGDCOD will get the increased size on reboot.

The rest of this patch area starts out as pageable exec. It may be made part of the nonpaged exec if more than one page of nonpaged patch space is needed.

PATSA_NONPGD_CODE_END:: ; [00000000 394 395 396 397 398 ; END OF NONPAGED PATCH AREA 00000000 00000000 0000 0000 0000

.PSECT YF\$\$\$PATCH_PAGED_CODE,LONG ; PATCH ARE FOR PAGED CODE

The pageable read-only patch area is placed approximately in the middle of the pageable exec to allow control to be passed into and out of the patch area with BRW instructions rather than JMP instructions.

Psect synopsis output Cross-reference output Assembler run totals	Ö	00:00:00.00	00:00:00.00
Assembler run totals	450	00:00:07.08	00:00:29.86

The working set limit was 1350 pages. 26101 bytes (51 pages) of virtual memory were used to buffer the intermediate code. There were 30 pages of symbol table space allocated to hold 456 non-local and 0 local symbols. 439 source lines were read in Pass 1, producing 36 object records in Pass 2. 16 pages of virtual memory were used to define 15 macros.

Macro library statistics !

Macros defined Macro Library name -\$255\$DUA28:[SYS.OBJ]LIB.MLB:1 -\$255\$DUA28:[SYSLIB]STARLET.MLB:2 TOTALS (all libraries)

493 GETS were required to define 9 macros.

MDAT Psect synopsis

There were no errors, warnings or information messages.
